All sound odd if e.g. snow is impossible.

Introduction The inferences of disjunction and modals

> The distributive inferences of certain and likely are derived straightforwardly by most accounts.

> > ◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Introduction The inferences of disjunction and modals

- The distributive inferences of certain and likely are derived straightforwardly by most accounts.
- ► The free choice inferences of *possible* are more problematic.

Introduction The inferences of disjunction and modals

> There is some consensus that both inferences should be treated as implicatures.
>  (Shimoyama and Kratzer 2002, Fox 2007, Alonso-Ovalle 2006, Klinedinst 2007, Chemla 2010 a.o.)

Introduction The inferences of disjunction and modals

> There is some consensus that both inferences should be treated as implicatures.
>  (Shimeyama and Kratzer 2002, Eex 2007, Alance Ovalla 2006, Klined

(Shimoyama and Kratzer 2002, Fox 2007, Alonso-Ovalle 2006, Klinedinst 2007, Chemla 2010 a.o.)

► In particular for their disappearance in DE contexts.

Introduction The inferences of disjunction and modals

> There is some consensus that both inferences should be treated as implicatures.
>  (Shimoyama and Kratzer 2002, Fox 2007, Alonso-Ovalle 2006, Klinedinst 2007, Chemla 2010 a.o.)

- ► In particular for their disappearance in DE contexts.

Introduction The inferences of disjunction and modals

- There is some consensus that both inferences should be treated as implicatures.
   (Shimoyama and Kratzer 2002, Fox 2007, Alonso-Ovalle 2006, Klinedinst 2007, Chemla 2010 a.o.)
- ► In particular for their disappearance in DE contexts.
- While both treated as implicatures, they are nonetheless treated differently.

Introduction The inferences of disjunction and modals

> We show that an independently motivated degree-based semantics for modals can predict all these inferences via the same mechanism.

Introduction The inferences of disjunction and modals

> We show that an independently motivated degree-based semantics for modals can predict all these inferences via the same mechanism.

• 
$$MOD(A \lor B) \land \neg MOD(A) \land \neg MOD(B)$$

Introduction The inferences of disjunction and modals

> We show that an independently motivated degree-based semantics for modals can predict all these inferences via the same mechanism.

► 
$$\operatorname{MOD}(A \lor B) \land \neg \operatorname{MOD}(A) \land \neg \operatorname{MOD}(B)$$
  
 $\rightsquigarrow \Diamond(A) \land \Diamond(B)$ 

Introduction The inferences of disjunction and modals

- We focus on epistemic modal adjectives.
- We sketch how the account can be extended to modals of other syntactic categories and different modal flavors.

The problem of free choice inferences

L Deriving distributive inferences

# Distributive inferences

-The problem of free choice inferences

L Deriving distributive inferences

# Scalar implicatures

 Assume an exhaustification-based analysis of scalar implicatures.

The problem of free choice inferences

L Deriving distributive inferences

## Scalar implicatures

Define EXH in a standard way

(8) 
$$[[exh]](p)(w) = p(w) \land \forall q \in Excl(p, Alt(p))[\neg q(w)]$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- The problem of free choice inferences

L Deriving distributive inferences

## Scalar implicatures

Define EXH in a standard way

(8) 
$$[[exh]](p)(w) = p(w) \land \forall q \in Excl(p, Alt(p))[\neg q(w)]$$

(9) 
$$Excl(p, Q) = \{q \in Q : p \not\subseteq q \land \neg \exists r [r \in Q \land (p \land \neg q) \subseteq r\}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

-The problem of free choice inferences

L Deriving distributive inferences

## Alternatives

 Assume that a disjunctive sentence like (10) has the alternatives in (11). (Sauerland 2004, Katzir 2007, Chemla 2010 a.o.)

(10) 
$$A \lor B$$

(11)  $\{(A \lor B), A, B, (A \land B)\}$ 

- The problem of free choice inferences

L Deriving distributive inferences

## Example

**•** Example: EXH applied to a simple disjunctive sentence.

◆□▶ ◆□▶ ◆∃▶ ◆∃▶ = のへで

- The problem of free choice inferences

— The account

Background on gradable adjectives

# The scope of $\operatorname{POS}$

 POS and more in general the Degree Phrase can take scope over some things but not others (Heim 2000, Kennedy 1997, Beck 2011, Romero 2015 a.o.)

The relevant syntactic constraints:

— The account

Background on gradable adjectives

# The scope of $\operatorname{POS}$

 POS and more in general the Degree Phrase can take scope over some things but not others (Heim 2000, Kennedy 1997, Beck 2011, Romero 2015 a.o.)

- The relevant syntactic constraints:
  - no quantifiers, no negation
  - but modals okay
  - ▶ arguments for movement (e.g., ACD . . . )

— The account

Background on gradable adjectives

# The scope of $\operatorname{POS}$

- POS and more in general the Degree Phrase can take scope over some things but not others (Heim 2000, Kennedy 1997, Beck 2011, Romero 2015 a.o.)
- The relevant syntactic constraints:
  - no quantifiers, no negation
  - but modals okay
  - ▶ arguments for movement (e.g., ACD . . . )
- These constraints are not very well understood, but generally adopted. (And we adopt them too.)
- But: we assume that POS can take scope over EXH.

Once you compose the meaning with POS you have

(75)  $[\operatorname{POS}[\operatorname{EXH}[d \text{ possible that it will rain or snow}]]] \\ \exists d[d > 0 \land Pr(r \lor s) \ge d \land Pr(r) < d \land Pr(s) < d]$ 

 And again given our analysis of *possible* the free choice inferences immediately follow

- The account
  - The Account in detail

#### In sum

- We can account for both distributive and free choice inferences via the same mechanism
- By treating epistemic modal adjectives as gradable adjectives and have EXH apply below POS

— The account

L The Account in detail

### Two main points for discussion

- 1. How this account extends beyond epistemic adjectives
- 2. How to respond to skepticism about a probabilistic implementation and the gradability of (some of) these adjectives

-Extensions and discussion

Beyond adjectives

# Outline

#### Introduction

The problem of free choice inferences Deriving distributive inferences Not extending to free choice

#### The account

### Modal auxilaries

Technically, we can extend the analysis straightforwardly

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Extensions and discussion

Beyond adjectives

# Modal auxilaries

Technically, we can extend the analysis straightforwardly

(78)  $\llbracket \text{might } p \rrbracket = \exists d[d > 0 \land Pr(p) \ge d]$ 

(79) 
$$\llbracket \text{must } p \rrbracket = \exists d [d = 1 \land Pr(p) \ge d]$$

Extensions and discussion

Beyond adjectives

## Modal auxilaries

Technically, we can extend the analysis straightforwardly

(78) 
$$\llbracket \text{might } p \rrbracket = \exists d[d > 0 \land Pr(p) \ge d]$$

(79) 
$$\llbracket \text{must } p \rrbracket = \exists d [d = 1 \land Pr(p) \ge d]$$

 The question is whether we can plausibly separate the degree element from the position in which existential closure would happen

So that we can insert an exhaustivity operator in between

Extensions and discussion

Beyond adjectives

## Modal auxilaries

There is some evidence for gradability of these auxiliaries too

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Extensions and discussion

Beyond adjectives

## Modal auxilaries

- There is some evidence for gradability of these auxiliaries too
  - (80) It might be that it's raining in Sydney
  - (81) It might very well be that it's raining in Sydney

But: can we find such a scale?

Extensions and discussion

Beyond epistemic modals

## Beyond epistemic modals

 One suggestion: expected utility (EU) semantics for deontic modals (Lassiter 2011).

Extensions and discussion

Beyond epistemic modals

# Beyond epistemic modals

One suggestion: expected utility (EU) semantics for deontic modals (Lassiter 2011). This won't work!

- Extensions and discussion

Beyond epistemic modals

# Beyond epistemic modals

- One suggestion: expected utility (EU) semantics for deontic modals (Lassiter 2011). This won't work!
- The reason: the EU of a disjunction is not, in general, an upper bound on the EUs of the disjuncts.

 $EU(p), EU(q) \not\leq EU(p \lor q)$ 

 (This is not a big drawback, since EU semantics for deontic modals are problematic—see e.g. Cariani 2015a,b.)

Extensions and discussion

Beyond epistemic modals

# Beyond epistemic modals

Our suggestion: use a probability scale also for deontic modals.

Roughly: It is required that p means that the probability of p, conditional on one of the deontically 'best' worlds being actualized, is 1.

[[it is POS required that p]] = 1 iff Pr(p|Best) = 1

Extensions and discussion

Beyond epistemic modals

## Beyond epistemic modals

Our suggestion: use a probability scale also for deontic modals.

Roughly: It is required that p means that the probability of p, conditional on one of the deontically 'best' worlds being actualized, is 1.

```
[[it is POS required that p]] = 1 iff Pr(p|Best) = 1
```

The account is similar for deontic adjectives with different force, like *allowed*.

Skepticism about gradability

# Modality and gradability

- ▶ We have assumed that these modal expressions are gradable
- This has been defended in the literature recently (Yalcin 2010, Lassiter 2010, 2011, a.o.)

 On the other hand, this approach has been challenged by others (e.g. Klecha 2014)

Extensions and discussion

Skepticism about gradability

# Modality and gradability

- Two main complaints
  - adjectives like *likely* are gradable but do not employ a probability scale

adjectives like *possible* are not gradable altogether

Extensions and discussion

Skepticism about gradability

# Arguments against probabilistic implementation

- proportional modifiers
  - (84) (??)It is 60% likely that it will rain
  - (85) #It it totally/completely likely that it will rain

Extensions and discussion

Skepticism about gradability

### Responses

We could use Klecha's scale, which is essentially a probability scale without end-points but

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Extensions and discussion

Skepticism about gradability

## Responses

We could use Klecha's scale, which is essentially a probability scale without end-points but

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Is it really that bad modifying *likely* with proportional modifiers?
  - (86) It's 60% likely that it will rain

- Extensions and discussion

Skepticism about gradability

### Responses

- We could use Klecha's scale, which is essentially a probability scale without end-points but
- Is it really that bad modifying *likely* with proportional modifiers?
  - (86) It's 60% likely that it will rain
- The problem of not-possible entailing not-likely
  - (87) It's not possible that it will rain therefore it isn't likely that it will rain

- Extensions and discussion

Skepticism about gradability

# Arguments against gradable analysis of possible

- comparatives and modifiers
  - (88) ??It's slightly possible that it will rain
  - (89) ??It's very possible that it will rain
  - (90) ??It's 30% possible that it will rain
  - (91) ??It's more possible that it will rain than it will snow

- Extensions and discussion

Skepticism about gradability

# Although

- (92) It is slightly possible that the Jets will win. (Lassiter 2010)
- (93) I felt that if it was 80-90 percent possible that [the cancer] hadn't spread, I didn't want the hysterectomy. (Lassiter 2011)
- (94) In fact, it is more possible that tomorrow is the zombie apocalypse than people magically floating away into the clouds. (Lassiter 2016)

Extensions and discussion

Skepticism about gradability

 Some of the data in the Lassiter/Klecha debate concerns the wrong kind of modifiers

・ロト ・西ト ・ヨト ・ヨー うらぐ

- Extensions and discussion

Skepticism about gradability

### Response

- Some of the data in the Lassiter/Klecha debate concerns the wrong kind of modifiers
- On a probabilistic analysis, *possible* is a minimum standard adjectives that exploit a closed scale

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

-Extensions and discussion

└─ Skepticism about gradability

## Response

- Some of the data in the Lassiter/Klecha debate concerns the wrong kind of modifiers
- On a probabilistic analysis, *possible* is a minimum standard adjectives that exploit a closed scale
- Some items with the same features (from Kennedy & McNally 2005): acquainted, documented, understood

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Extensions and discussion

Skepticism about gradability

### Response

In English, Possible does share modifiers with these items: e.g. scarcely and (at least in British English) well

(95) It's (very) well possible that Mary will win the race

- Similar situation in Italian, where the relevant intensifier is ampiamente
  - (96) È ampiamente possible che Maria vinca la gara Is amply possible that Mary win the race

Extensions and discussion

Skepticism about gradability

In sum

It's at least not obvious that a probabilistic implementation of *likely* and *certain* is problematic

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Extensions and discussion

Skepticism about gradability

#### In sum

- It's at least not obvious that a probabilistic implementation of likely and certain is problematic
- And it's also not obvious that a gradable analysis of *possible* is problematic

- Extensions and discussion

Skepticism about gradability

### In sum

- It's at least not obvious that a probabilistic implementation of likely and certain is problematic
- And it's also not obvious that a gradable analysis of *possible* is problematic
- In fact, there is some evidence for a 'spotty gradability' of possible with modifiers like well or ampiamente
